TYPICAL LOT DETAIL

NOTES

1. The purpose of the Typical Lot Detail is to graphically depict the defined relationship between the "Full Pool Level" and the "Project Boundary." Atypical Project Boundary conditions are so noted and/or depicted on the plat.
2. Definitions:
   - 2.1. Full Pool Level - The water elevation at maximum reservoir storage capacity.
   - 2.2. Project Boundary - Limits of the Federal Energy Regulatory Commission (FERC) regulated area. The project boundary coincides with a Lot, Block, and OUTLOT- boundary within the plat. (See note 5).
   - 2.3. Waterline - The intersection of the contiguous reservoir water surface and the upland. (See note 6).
3. The Full Pool Level is defined as 1454.00 feet (NGVD 29) , or 1454.59 (NAVD 88). Although the Full Pool Level is fixed in the vertical dimension, the horizontal location may change through time due to the action of the natural forces of accretion and reliction.
4. Isolated areas, non-contiguous with the main body of the reservoir, lying within a Lot, and falling below the Full Pool Level are not within the Project Boundary.
5. The Project Boundary is a line parallel with and 3.00 feet upland, horizontal measure, of the Full Pool Level as depicted upon the plat. The Project Boundary is the boundary between each Lot and OUTLOT- A. Since the horizontal location of the Full Pool Level may change through time due to the action of the natural forces of accretion and reliction, so may the location of the Project Boundary.
6. The elevation and horizontal location of the "Waterline" (not depicted) is transient, variable, and generally at or below and lakeward of the Full Pool Level.
7. The public has neither been granted, nor has it accrued, rights to the underlying bed of the reservoir, excepting the rights of the State of Minnesota in the portions of the underlying bed of the reservoir, if any, that constituted navigable waters of the United States at the time of statehood.
